A clinical trial is a planned experiment designed to answer questions concerning the most appropriate treatment of future patients with a specific medical condition. Clinical trials use results based on a limited sample of patients to make inferences about how treatment should be conducted in the general patient population.

Clinical Trials Concept - crawb.crab.org

The brown meat from crab may contain high levels of the heavy metal cadmium. Cadmium is found in the environment and long-term exposure can cause accumulation in the body. High cadmium levels can be toxic to the kidney and have been statistically associated with an increased risk of cancer in the lungs, endometrium, bladder, and breast.

CRAB ' s approach to preventing and curing cancer is to collaborate with investigators to design, implement, and execute clinical trials such that reliable and replicable results are obtained. Clinical trials are extremely expensive and will guide new therapeutics, prevention programs and standards of care. Thus we contribute our expertise from the design of the study and protocol development through to the final analysis and publication of results.

However, clinical trials also have the potential to pose unknown risks to their participants, and biased knowledge extracted from flawed clinical trials may lead to the inadvertent harm of patients. Although conducting a well-designed clinical trial may appear straightforward, it is founded on rigorous methodology and oversight governed by key ethical principles.

It is intended to accelerate the transition from discovery research to translational development projects by supporting preliminary work or feasibility studies to establish the viability of an approach. Early phase proof of concept trials are supported through the BMC Developmental Pathway Funding Scheme (DPFS). The scheme supports the pre-clinical development and early clinical testing of novel therapeutics, devices and diagnostics, including “ repurposing ” of existing therapies
