Israel Nathan Herstein - Wikipedia

If $n = 0$, then $(ab)^0 = e$ where e is the identity element. Therefore $(ab)^0 = e = ee = a^0 b^0$. So the result is valid for $n = 0$ too. Next suppose n is a negative integer. So $n = -m$, where m is some positive integer. We have $(ab)^n = (ab)^{-m} = ((ab)^{-1})^m$ by definition of the notation $= (b^{-1} a^{-1})^m = ((a^{-1})^{-1} (b^{-1})^{-1})^m = (a^{-1})^m (b^{-1})^m$ as the result is valid for positive integers $= (a^{-m}) (b^{-m}) = a^{-n} b^{-n}$

claim by induction over n . For base case $n=1$, we have $(a+b)^1 = a+b = P \times 1 = a$ or $b \times 1$. So for $n=1$, expression is valid. Suppose the expression $(a+b)^n = P \times i = a$ or $b \times 1 \times 2 \times n$ is valid for $n=m-1$, we will show the expression is then valid for $n=m$ too.
